

Publishing and Sharing in Tableau									
QUESTION 1	What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security?								
ANSWER	Tableau Public Accessibility: Fully public — anyone on the internet can view it without logging in. Data Security: No security — the data behind the dashboard is also publicly available. Use Case: Sharing portfolios, practice projects, or non-sensitive data. Tableau Server / Tableau Cloud Accessibility: Restricted — only authorized users with login access can view it. Data Security: Strong security — supports user authentication, permissions, and data governance. Use Case: Business dashboards with confidential or sensitive data. Tableau Public → Open access, no data security Tableau Server/Cloud → Controlled access, high data security								

QUESTION 2	When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?
ANSWER	Live Connection What happens when published? The dashboard stays directly connected to the original data source (database, server, etc.). Always shows real-time data — no need to schedule refresh. Data source is large Network/server is slow Many users are accessing at once Extract (Hyper Extract) What happens when published? Tableau creates a snapshot of the data and stores it with the dashboard. Data Refresh: Not real-time — requires scheduled refresh (daily, hourly, etc.). Faster performance because: Data is optimized (compressed, indexed) No need to query the live database every time When to Use What? Use Live Connection → When real-time data is critical (e.g., stock prices, live monitoring) Use Extract → When performance matters and slight data delay is acceptable (e.g., sales reports)

QUESTION 3	In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?
ANSWER	Who can view a dashboard Who can interact (filter, drill, download) Who can edit or publish content Users (individual accounts) Groups (e.g., Sales Team, HR Team) View Explore Download Edit Publish Permissions decide “who can do what” with a dashboard. Example Sales team → Can view and interact Managers → Can edit Admin → Full control

QUESTION 4	If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?
ANSWER	Allow: View (so users can see the dashboard) Deny/Remove: Download Data How it works Tableau permissions include specific capabilities like: - View - Interact (filters, drill-down) - Download Data (disable this) By turning off Download Data, users can: - See and interact with the dashboard - But cannot export or access the underlying data I would disable the 'Download Data' permission while keeping 'View' enabled, so users can access the dashboard but cannot download the underlying data

QUESTION 6	List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.										
ANSWER	1. Remove or Anonymize Sensitive Data Never include personally identifiable information (PII) like: Names Phone numbers Email IDs Replace with: Aggregated data (e.g., total sales instead of customer-level data) Masked values (e.g., Customer A, B)										

QUESTION 8	When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content
ANSWER	1. Authentication (SSO / Trusted Authentication) Ensure users are properly authenticated before accessing the dashboard Common methods: SSO (Single Sign-On) using SAML/OAuth Trusted Authentication (server trusts your web app) 2. Authorization (Permissions / User-Based Access) Use Tableau Permissions to control what each user can access Restrict: Which dashboards they can see What actions they can perform This controls what the user is allowed to Authentication = Who are you? Authorization = What can you access?
